

HYALIQUE-X

Advanced Hybrid Adjustable Dual-Molecular Hyaluronic Acid

Fillers with HA-Peptides Complex

ADVANCED HYBRID HA TECHNOLOGY

HYALIQUE-X is developed with an advanced hybrid dual-molecular hyaluronic acid platform that integrates Soft (Low-Density) and Hard (High-Density) Hyaluronic Acid Fillers with peptide-assisted bio-remodeling. The formulation is designed to provide balanced structural support, intensive hydration, and multi-layer skin regeneration, while its refined cross-linked matrix enhances viscoelastic performance, promotes smooth tissue integration, and supports long-lasting aesthetic results.

Clinical Grade

Bioactive

Kit Composition

Component	Volume	Description	Primary Function	
 Small-Molecular Hyaluronic Acid	2 ml (18 mg)	Deep acting cross-linked hyaluronic acid	Deep dermal hydration with long-lasting effect	Skin texture refinement & elasticity improvement
 Large-Molecular Hyaluronic Acid	2 ml (36 mg)	Structural cross-linked hyaluronic acid	Provides structural support with visible lifting	Maintains long-term and stable dermal volume
 Lyophilized Peptides	300 mg	Regenerative peptide complex	Stimulates collagen synthesis at dermal level	Enhances overall skin regeneration process

BEFORE & AFTER

Before

After

Before

After

Before

After

Small Molecular Hyaluronic Acid

→ A lower-viscosity, highly integrative phase that promotes smooth tissue distribution and superficial hydration, commonly applied in delicate areas including the lips, tear troughs, and fine rhytids.

Large Molecular Hyaluronic Acid

→ A high-viscosity, structurally cross-linked phase designed to provide enhanced projection, volumization, and mechanical support, typically indicated for deep anatomical regions such as the cheeks, jawline, and chin.

Hybrid HA-Peptide Cooperative Complex

→ A dual-molecular platform combining HMW-HA or LMW-HA with bioactive Peptides Complex to modulate rheological properties and optimize viscoelastic balance, enabling versatile application across midface volumization, nasolabial folds, and overall bio-remodeling indications. with hybrid HA-Peptide solution physician can adjust viscosity according to requirements.

Peptide Therapy (Adjunct Protocol)

→ An additional peptide therapy session may be performed one month post-treatment to promote muscle relaxation, enhance cellular regeneration, and support ongoing dermal bio-remodeling for optimized aesthetic outcomes.
